Detailed Action

1. Claims 1-13 are pending.

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 10/19/2009 has been entered.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1-13 are rejected under 35 U.S.C. 103(a) as being obvious overBu (US Patent Application Publication 2002/0101172).

Regarding **independent claim 1**, Bu discloses an active-matrix image display device comprising: several light emitters forming an array of emitters distributed in rows and columns (*figure 2 and paragraph [0002] wherein an active driving system refers to an active matrix driving system which comprises of a two dimensional arrays of*

Art Unit: 2629

OLEDs in rows and columns); power supply means capable of supplying current simultaneously to all of the emitters of each column through one single power supply line during emission steps and programming steps of the emitters of said column (figure 2 reference ground directly connected to transistor 21 wherein the current flowing through the OLED by the DRV shown in figure 2 is in direct relation to the ground connected through transistor 21 or reference Vs wherein Vs is only supplied during programming but is capable or supplying power during the emission step if transistor 54 were turned on, further reference response to arguments below wherein "DRV" line is a feedback line and not a power supply line); means for controlling the emission of the emitters comprising: for each emitter of the array, a current modulator comprising a source electrode, a drain electrode and a gate electrode, a drain current being able to pass through said modulator in order to supply said emitter, for a voltage between the drain or the source and the gate equal to or greater than a trip-threshold voltage (figure 2 reference 21 and paragraphs [0020]- [0022]),

for each modulator, storage means capable of storing electric charges at the gate electrode of the modulator (*figure 2 reference 23*), for each row emitters, row select means capable of selecting in succession the emitters of each row of emitters, for programming these emitters (*figure 2 reference scan signal 3 sent to 54, 53, and 22*), and

for each column of emitters, column address means capable of addressing in succession each selected emitter of said column of emitters by applying, during the programming step of this selected emitter, a value representative of a data set point to the gate electrode of the modulator

Art Unit: 2629

associated with this emitter in order to actuate it (figure 2 reference 4 and paragraphs [0019]-[0022]), during a programming step, for each row of emitters, row select means capable of selecting in succession the emitters of each row of emitters (figure 2 reference 3 and paragraphs [0019]-[0022]), during the programming step and for each modulator, storage means capable of storing electric charges at the gate electrode of the modulator (figure 2 reference 23 and 21 and paragraph [0022]); and tripthreshold voltage compensation means comprising comparators, the comparators being capable of comparing, during the step of programming a selected emitter, a value representative of the drain current supplying the selected emitter with the value representative of the data set point for controlling the quantity of charge stored in the storage means, wherein the compensation means comprise, for each column of emitters, a one single separate unit for determining a representative value of the drain current supplying the selected emitter on the basis of a measurement of a representative value of the current for supplying all of the emitters of the column (paragraphs [0020]-[0022] wherein the capacitor 23 of figure 2 is adjusted so that the OLED is not affected by the characteristics of transistor 21 and figure 2 reference 6 for current comparator which compares drive current with a reference current).

Bu does not disclose a single separate unit for determining a value of drain current across the pixel OLED.

Bu does disclose a unit 6 within the active matrix pixel to determine the drain current through the OLED (paragraphs [0018]-[0019]).

Application/Control Number: 10/583,924

Art Unit: 2629

It would have been obvious to one skilled in the art at the time of the invention that placing the detection circuit 6 within the active matrix pixel enables the detection circuit to enable constant detection of the emission current at a faster rate as compared to a passive matrix scheme wherein the signal must be brought out of the pixel to be compared and placed back into the pixel.

Page 5

Regarding **claim 2**, Bu discloses an image display device, wherein the power supply means for the emitters are connected directly to each modulator of the control means (*figure 2 reference ground directly connected to transistor 21*).

Regarding **claim 3**, Bu discloses an image display device, wherein the power supply means for the emitters are connected directly to each emitter of a column through one single power supply line(*many different driving schemes are available to send current to the OLED however in the case of Bu transistor 21 and 54 open or switch to an on state to directly connect the OLED to their respective power supplies).*

Regarding **claim 4**, Bu discloses an image display device, wherein the power supply means for the emitters comprise a voltage supply generator capable of supplying all of the emitters of a column through one single power supply line and wherein the compensation means are capable of compensating in succession the trip-threshold voltage of each modulator of all of the emitters of this column (*paragraphs* [0020]-[0022] and figure 2 reference 6 and VS and ground).

Regarding **claim 5**, Bu discloses an image display device, wherein the compensation means further include: a drive generator capable of generating a drive signal applied to the gate of said modulator (*figure 2 reference 4*); and means

for modulating the duration of said drive signal according to the value of the data set point and the value of the trip-threshold voltage (paragraphs [0020]-[0022] wherein switch 54 switches to an off state to stop current from flowing into the OLED and hence stop the duration of emitting light).

Regarding **claim 6**, Bu discloses an image display device, wherein the data set point is a data voltage and in that the comparators are capable of emitting a warning signal when the voltage representative of the intensity of the drain current is equal to a number of times said data voltage (*figure 3 N1 and N2 provide the same function as a comparator and generate an output/warning signal through Nd2 and N3d to create a proportional output to the OLED paragraphs [0025]-[0026]).*

Regarding **claim 7**, Bu discloses an image display device, wherein the means for modulating the duration of the drive signal comprise: a switch connected in series with the drive generator (*figure 3 reference P3*); and a control unit capable of switching said switch (*figure 3 reference 6 specifically control unit N1 and N2 disclose whether to increase or decrease/data set point received or warning signal received via using N3 paragraphs [0025]-[0026]*), on the one hand, when the data set point is received, and on the other hand, when the warning signal is received.

Regarding **claim 8**, Bu discloses an image display device, wherein the drive signal generated by the drive generator is amplitude-modulated according to the value of the data set point (paragraph [0025]-[0026] disclose wherein the drive current is increased or decreased which is amplitude modulation).

Regarding **claim 9**, Bu discloses an image display device, wherein the drive generator is a current generator and the modulator is capable of being

Art Unit: 2629

current-controlled (figure 6 reference N2 and N1 which is a current mirror current controlled and paragraphs [0025]-[0026] wherein a drive current is output to the OLED).

Regarding **claim 10**, an image display device, wherein the drive generator is a ramp voltage generator and the modulator is capable of being voltage-controlled.

Such a driving and control scheme does not emphasize any significance as what would be the benefit from applying such organization. Therefor, the examiner asserts that such are based on the design choice of device and provide no specific improvements and are merely inherent variations through the relationship of current and voltage to that disclosed in claim 9. Therefor, claim 10 is rejected on the same grounds as claim 9 and as discussed above.

Regarding **claim 11**, Bu discloses an image display device, wherein the compensation means further include a unit for measuring the intensity of a current, capable of measuring the intensity of the drain current passing through a selected emitter during the programming step (paragraphs [0020]-[0022] wherein transistor 53 is left on to measure intensity of current passing through OLED in a programming step before emitting light).

Regarding **claim 12**, Bu discloses an image display device, wherein the supply means comprise a line to which the measurement unit is directly connected (*figure 2 reference 6 connected directly to ground*).

Regarding **claim 13**, Bu discloses an image display device, wherein the storage means comprise at least one storage capacitor connected to the gate

Art Unit: 2629

and to the source of the modulator and in that the compensation means further include reset means capable of applying a voltage pulse to said capacitor in order to discharge it (figure 2 reference 23 and paragraph [0022] wherein adjustment includes charging and discharging).

Response to Arguments

5. Applicant's arguments filed 3/26/2009 have been fully considered but they are not persuasive. Applicant argues that Bu discloses two different power supply lines are needed for each column "DRV" and "Vs". Examiner believes that DRV has been mistaken for a supply line. Paragraphs [0018]-[0019] describe wherein current comparator only operates when transistor 53 is turned on by the scan signal in which to enable the comparator to receive the driving current flowing through the OLED. "DRV" is a feedback line not a power supply line, accordingly only Vs and ground (and by loose definition by applicant the data line) are the only supply lines used to supply the pixel a value. The current comparator further, as disclosed by paragraphs [0018]-[0019], has only a single output Vfs which either increases or decreases the data signal depending on the comparison between the data current flowing through the OLED and the reference current. Further, the rejection uses ground as the power supply line which in of itself is a single line, applicant provided no rebuttal for previous response of using ground as power supply line therefor the rejection regarding such will remain the same modified as amended.

Art Unit: 2629

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CHRISTOPHER E. LEIBY whose telephone number is (571)270-3142. The examiner can normally be reached on 9 - 5 Monday - Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Alexander Eisen can be reached on 571-272-7687. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
